I'm finding it much easier to just make a whole library of functions and variables that I can use throughout my application, and just get them working, and then refactor them later when I'm already familiar with how they all work together. How do you generally go about this? A: At this stage in your career, I wouldn't waste too much time on that. A good mentor/teacher can help with that. A: There is no direct way to build a testable application. You need to think about what you are doing for the purpose of a testable system. If you are checking the return values from some function or method f678ea9f9e
